

## Treatment now is more effective than it was before?

Written by врач невролог А.А.Пономаренко

---

Which diseases can be treated more effectively in comparison with the past? I will describe everything I know in details on this site in a form of videos and articles. If the questions about the things I have not described arise, I will answer it since I am going to publish content constantly. Everybody who is interested in ideas stated here can use and share it according his own wish. The main point is in not letting them disappear and let them develop because the method potential in diagnosis and therapy is much more broader then what we accustomed to use.

Now I would like to give a list of those diseases that can be cured effectively by this method and those that can be cured less effectively but the result will be better than by using common methods. Despite this fact, the result can not be compared with results from common methods. Nevertheless, this is a traditional physiology that we were thought but used in another way. Suggested method when used with classic medicamental treatments can significantly increase the effectiveness of rendering of assistance.

### **1. Diseases that can be treated:**

Headache, migraine, lethargy, trigeminal neuralgia, pain in chest, neck, loin, intercostal neuralgia, radiculitis, sciatica, spinal disk herniation.

### **2. Diseases with significant improvement after treatment:**

Epilepsy, tic, tremor, Parkinson's disease, asthma, cerebrovascular accident, heart diseases(heart block, arrhythmia, ischemic heart pain), thyroid swelling, vertigo, hypotension, hypertension (stage 1,2), vasoneurosis, gastritis, prostatitis, hormonal imbalance, some forms of infertility.

It is difficult to start thinking in a way we are not used to. In other words, when we apply this approach we do not cure anything, we only stimulate the brain and when it turns on, it puts everything in order by it's own. It is more reasonable than intrusion with chemical medicines which can not fundamentally change the situation and have side-effects.

I would like to explain why diseases are divided into 2 lists. The first reason is that most of my patients came with problems with the musculoskeletal system that is why there are more

observations concerning this matter. The second one is that reflexology that I practice is most effective for functional disorders. Functional disorder is a medical condition that impairs the normal function of a bodily process, but where every organ, tissue or nucleus look completely normal. Microscopic structural changes are not seen and cellular changes are considered as functional. There is also the difference between different tissues specificity and activity. For instance, significant organic changes in bones and muscles may not lead to severe and serious changes in all body. On the contrary, insignificant organic and functional disorders in tiny brain centers may result in numerous and severe changes in the whole organism. Changes can be of functional or organic nature and do not differ in an external form. Therefore, treatment result of the same diseases can vary. If nerve center is damaged slightly, complete recovery is possible. If it is badly damaged, there will be no effect. Unfortunately, it is almost impossible to differentiate these situations. Consequently, two different people with the same disease may expect different results. Luckily, RANC treatment approach is capable to open resources inaccessible before. Thus, even in hopeless cases, result may be surprising.
